SUMMARY

Backend developer with 1.5 years of commercial experience in C# / .NET, delivered while completing a programming diploma. Used to owning a feature end to end: designed and shipped REST endpoints on a team of under 10, automated a manual operator workflow in Python, and built and released a Kotlin Android application as the sole developer. Joined an unfamiliar PHP / JavaScript codebase with no prior experience and was shipping to production within weeks. Looking for a backend or full-stack role where I can take ownership of services and grow into modern .NET.

TECHNICAL SKILLS

Languages - C#, Python, Kotlin, SQL, JavaScript, PHP

Backend - .NET Framework, REST API design, Oracle SQL, unit & integration testing

Frontend - React, jQuery, JavaScript, HTML, CSS (responsive)

Mobile - Kotlin, Jetpack Compose, Hilt, Room, Coroutines / Flow, MVVM

Tools - Git, Gradle, Linux (basics)

EXPERIENCE

Junior Developer - Optumplus, Riga, Latvia

November 2024 – April 2026 · engineering team of under 10

- As sole developer, replaced a telephony-based guard check-in process - officers confirmed shift start, shift end and patrol checkpoints by dialling a number assigned to each site, which proved nothing about where they actually were - with a Kotlin Android client and a rewritten C# / .NET backend over Oracle.
- Implemented checkpoint scanning with GPS proof-of-presence: sites use NFC tags or printed QR codes depending on the client's setup, and every scan is validated against the site's registered coordinates, raising a warning event when the officer's position exceeds the allowed tolerance.
- Mapped missed check-ins and skipped checkpoints onto the alarm events of the company's existing monitoring platform, so the move from telephony to the mobile client required no change to operator workflows.
- Reached pilot on live client sites in six months and supported it for four more - fixing defects and shipping changes requested by client administrators.
- Built a Python automation service for outbound taxi-order phone calls, replacing a repetitive manual step in the operators' daily workflow.
- Wrote and optimised Oracle SQL queries for reporting and data-processing tasks.
- Took over and extended legacy PHP web applications (server-rendered pages with jQuery), starting with no prior PHP experience and delivering production changes within the first weeks.

PERSONAL PROJECTS

Poker Tracker – Android · Sole developer · Closed testing on Google Play

Kotlin · Jetpack Compose · Material 3 · MVVM · Hilt · Room · Coroutines / Flow - [Repository](#)

Bank-keeping app for home poker cash games: tracks buy-ins, rebuys and cash-outs, reconciles final chip counts against money in, and settles the night as a short list of "A pays B" payments.

- Layered ui / domain / data architecture with dedicated money and chip value types instead of floating point, so settlement results are exact; unit tests cover arithmetic, settlement, Room migrations and ViewModels.
- Game handover between phones by QR code or file (kotlinx.serialization, ZXing); localised into five languages.
- Release-ready setup: AdMob with UMP consent, a one-time Play Billing purchase, signed and minified builds, lint treated as errors.

Personal Finance Tracker - Android

Kotlin · MVVM · Jetpack · Room (SQLite) · offline-first - [Repository](#)

- Personal finance app that works fully offline: expense tracking, categories and summaries with no network dependency.
- Clean MVVM architecture on Jetpack components; local persistence through Room.

EDUCATION

Vocational Secondary Education - Programming / Computer Science

Riga Technical College · September 2023 – June 2026 · admitted directly into year 2 · graduated

- Diploma project - Guard Tour & Shift Attendance System:** NFC / QR checkpoint scanning with GPS proof-of-presence - a Kotlin Android client plus a rewritten C# / .NET backend over Oracle, replacing a legacy telephony-based check-in; piloted on live client sites.
